Soil water holding capacity

Soil water is made up of plant available and plant unavailable water. Plant available water is the water in the soil profile between the full point and permanent wilting point (when the plant can no longer be revived by irrigation or rainfall). Within plant available water is readily available water (RAW). This is the water the crop can easily access. When the RAW has been used up the soil is regarded as being at the refill point.

Irrigation scheduling aims to replace the RAW. But before scheduling decisions can be made the amount of RAW in the root zone needs to be known.

To determine the RAW you need to know:

- The effective rooting depth – how much of the soil profile are roots accessing?
- The soil texture – soil texture influences the soil’s water holding capacity.
- The soil tension where crops begin to stress – for sugarcane this is about -100 kPa.

Effective rooting depth

The best way to determine the effective rooting depth is to dig a hole in the crop row and measure how far down the majority of the roots go.

<table>
<thead>
<tr>
<th>Soil texture</th>
<th>Readily available water (mm water per m soil) between field capacity and different stress levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sandy</td>
<td>-20 kPa 30 35 35 40 45</td>
</tr>
<tr>
<td>Loamy sand</td>
<td>45 50 55 60 65</td>
</tr>
<tr>
<td>Sandy loam</td>
<td>45 60 65 70 80</td>
</tr>
<tr>
<td>Loam</td>
<td>45 65 75 85 105</td>
</tr>
<tr>
<td>Sandy clay loam</td>
<td>40 60 70 80 100</td>
</tr>
<tr>
<td>Clay loam</td>
<td>30 55 65 80 105</td>
</tr>
<tr>
<td>Light clay</td>
<td>27 46 57 70 90</td>
</tr>
<tr>
<td>Medium clay</td>
<td>24 43 55 65 83</td>
</tr>
<tr>
<td>Heavy clay</td>
<td>21 40 53 60 81</td>
</tr>
</tbody>
</table>

Soil texture

Many soil tests now report soil texture. If the test doesn’t have soil texture then it can be determined by hand texturing (see chart).

If there are different soil layers within the effective rooting zone the soil texture for each layer needs to be determined.

Calculating RAW

Once the rooting depth and soil texture are known the RAW in the root zone can be calculated by multiplying the depth of the root zone (m) by the typical RAW (mm/m) at a given soil tension (Table 1).

For example: Rooting depth is 40 cm; soil texture is a sandy loam; soil tension for irrigation is -100 kPa. From Table 1 the RAW (mm/m of soil) at -100 kPa is 70 mm. RAW in the root zone is then 70 mm × 0.4 m = 28 mm.

Using RAW for scheduling

When the RAW is known, crop water use numbers (see Crop Water Use Information Sheet IS13023) can be used to calculate when the crop will again require irrigation. If the RAW is 28 mm and the crop is using 14 mm per week; it will need to be irrigated in two weeks time.
Determining soil texture by hand texturing

Place approximately 25 g (2 tablespoons) of soil into the palm of your hand and add water gradually until it is moist. Knead the soil to break down any lumps and make it mouldable like putty.

1. **Does the soil remain in a ball when squeezed?**
   - No: Soil is too dry
   - No: Soil is too wet
   - No: SAND
   - No: LOAMY SAND

2. **Does soil form a ribbon when squeezed between thumb and forefinger? Allow it to break under its own weight, how long is the ribbon?**
   - No: Ribbon is weak and less than 25 mm long
   - Distinct coherence, feels gritty/sandy
   - Feels smooth and silky
   - Slight coherence, feels gritty/sandy
   - Slight coherence, feels gritty/sandy
   - Distinct coherence, feels gritty/sandy
   - Feels smooth and silky
   - Ribbon is 25 to 50 mm long
   - Ribbon is strong and longer than 50 mm
   - Easily moulded with a sandy feel
   - Easily moulded and feels smooth and silky
   - Smooth and easily moulded like plasticine
   - Smooth and easily moulded like plasticine
   - SILTY CLAY/LIGHT CLAY
   - MEDIUM /HEAVY CLAY
   - SANDY CLAY
   - SANDY CLAY
   - LOAMY SAND
   - LOAM
   - SILTY LOAM
   - SILTY CLAY
   - CLAY LOAM
   - LOAM
   - SAND

3. **Ribbon is 25 to 50 mm long**
   - Distinct coherence, feels gritty/sandy
   - Feels smooth and silky
   - Easily moulded and feels smooth and silky
   - Smooth and easily moulded like plasticine
   - SILTY CLAY/LIGHT CLAY
   - MEDIUM /HEAVY CLAY
   - SANDY CLAY
   - SANDY CLAY
   - LOAMY SAND
   - LOAM
   - SILTY LOAM
   - SILTY CLAY
   - CLAY LOAM
   - LOAM
   - SAND

4. **Ribbon is strong and longer than 50 mm**
   - Easily moulded with a sandy feel
   - Easily moulded and feels smooth and silky
   - Smooth and easily moulded like plasticine
   - SILTY CLAY/LIGHT CLAY
   - MEDIUM /HEAVY CLAY
   - SANDY CLAY
   - SANDY CLAY
   - LOAMY SAND
   - LOAM
   - SILTY LOAM
   - SILTY CLAY
   - CLAY LOAM
   - LOAM
   - SAND

5. **Feels smooth and silky**
   - Easily moulded and feels smooth and silky
   - Smooth and easily moulded like plasticine
   - SILTY CLAY/LIGHT CLAY
   - MEDIUM /HEAVY CLAY
   - SANDY CLAY
   - SANDY CLAY
   - LOAMY SAND
   - LOAM
   - SILTY LOAM
   - SILTY CLAY
   - CLAY LOAM
   - LOAM
   - SAND

6. **Slight coherence, feels gritty/sandy**
   - SANDY LOAM
   - NO
   - Feels smooth and silky
   - SILTY LOAM
   - NO
   - Feels spongy and greasy
   - LOAM

7. **Distinct coherence, feels gritty/sandy**
   - SANDY CLAY
   - NO
   - Feels smooth and silky
   - SILTY CLAY
   - NO
   - Feels smooth with no sandiness
   - CLAY LOAM

8. **Ribbon is weak and less than 25 mm long**
   - SANDY LOAM
   - NO
   - Feels smooth and silky
   - SILTY LOAM
   - NO
   - Feels spongy and greasy
   - LOAM

9. **Soil is too dry**
   - Add more water
   - Add dry soil to soak up excess water

10. **Soil is too wet**
    - Allow it to break under its own weight, how long is the ribbon?
    - No: Ribbon is weak and less than 25 mm long
    - Distinct coherence, feels gritty/sandy
    - Feels smooth and silky
    - Slight coherence, feels gritty/sandy
    - Distinct coherence, feels gritty/sandy
    - Feels smooth and silky
    - Ribbon is 25 to 50 mm long
    - Ribbon is strong and longer than 50 mm
    - Easily moulded with a sandy feel
    - Easily moulded and feels smooth and silky
    - Smooth and easily moulded like plasticine
    - SILTY CLAY/LIGHT CLAY
    - MEDIUM /HEAVY CLAY
    - SANDY CLAY
    - SANDY CLAY
    - LOAMY SAND
    - LOAM
    - SILTY LOAM
    - SILTY CLAY
    - CLAY LOAM
    - LOAM
    - SAND
